

Repository Validation Summary

This file summarizes which modules have been hardened, validated, and documented during the current pass.

Status:

- appserviceplan: Hardened, validated, docs present ([VALIDATION_REPORT.md](#), [MODULE_COMPLETE.md](#), [QUICK_REFERENCE.md](#)).
- applicationgateway: Hardened, validated, docs present ([README.md](#), [EXAMPLES.md](#), [VALIDATION_REPORT.md](#), [MODULE_COMPLETE.md](#), [QUICK_REFERENCE.md](#)).
- rg: Hardened, validated, docs present.
- adf: Hardened, validated, docs present.
- appregistration: README present for module usage and outputs.
- appservice: Hardened, validated, docs present.
- winvm: Hardened, [VALIDATION_REPORT.md](#) and [MODULE_COMPLETE.md](#) present. Diagnostics omitted due to provider compatibility.
- sqldb: Hardened, validated, docs present.
- sqlmi_db: Partially hardened (locals/outputs/docs added); variables/main updated — recommend running `terraform validate` in `modules/sqlmi_db` with required inputs to finalize.
- linuxvm: README present for module usage; expanded example/reference docs are still limited.
- automationaccount: Module docs present and updated for explicit private endpoint controls and managed identity role assignments.
- automationaccount: Module docs present and updated for explicit private endpoint controls, managed identity role assignments, and private DNS zone lookup pattern.

Notes & recommended next actions:

- Normalize `azurerms` provider version across repo (pin in root) so diagnostics schema can be applied consistently.
- Repository CI now uses root `fmt`, `validate`, `terraform test -filter=tests/root-plan.tftest.hcl`, and one-module-at-a-time root-harness `terraform plan` runs in both GitHub Actions and Azure DevOps.
- Continue moving any module that only validates correctly in isolation toward clean root-harness planning so the CI matrix can cover it reliably.
- Complete `sqlmi_db` validation by ensuring it plans cleanly through the root harness and by fixing any remaining variable or provider issues.
